

PHOTRAN

Legend

Each folder denotes a single Eclipse plug-in. Each plug-in consists of a single project in CVS named `org.eclipse.photran.<foldername>`.

Thickly-bordered gray boxes denote Eclipse features. Smaller gray boxes inside denote a conceptual subdivision of a feature.

Dotted arrows denote dependencies. To minimize clutter, arrows between gray boxes denote a dependency between components; generally, the core components of one component depend on the core components of another, and the UI components depend on both core and UI components.

* Analysis and refactoring support was originally in a separate feature ("vpg-feature" in CVS) but is included in the main Photran feature for convenience. A different parser, AST, etc. could be contributed to Photran by replacing this feature with a different one. Such a feature was prototyped at IBM Research during Summer, 2008, but was not made public.

** C Preprocessor support and GNU compiler support could be in separate features but are included in the main Photran feature for convenience.
